TITLE: Wireless device with vibrational communication capabilities

----- KWIC -----

Detail Description Paragraph - DETX (23):

[0043] FIG. 8 illustrates a PDA incorporated with the vibrational communication facilities of the present invention, in accordance with one embodiment. PDA 800 is shown including body casing 816, display 808 disposed on the front side of body casing 816, input key pad 802 and mode select switch 832. Except for the teachings of the present invention, the items depicted in FIG. 8 all perform their conventional functions. In accordance with the teachings of the present invention, mode select switch 832 facilitates switching PDA 800 between a first vibrational communication mode and a second non-vibrational communication mode. In one embodiment of the invention,

alphanumeric data received by PDA 800 via e.g. a communication interface and/or receiver is vibrationally output in the form of Morse code vibrational representations, in conjunction with a vibration unit and complementary logic (as shown e.g. in FIG. 5). However, as with mobile phone 400 and wireless pager 700, the functionality provided to PDA 800 by mode select switch 832 may instead be provided through one or more keys of input key pad 802, or in the case where display 808 represents a touch screen, the functionality provided by mode select switch 832 may instead be provided through touch input via display 808.
